

SEEDLING INSTRUCTIONS

How to care for your seedling when you get home, option 1

1

Tape your seedling pouch to a sunny window - southern or eastern-facing windows are best

2

Check your cotton balls every day - are they wet or dry? If dry: Place cotton ball in a 4 oz. cup of water for 20-30 seconds, then place back in your bag, wrapping around seed

3

Watch as your seed begins to grow roots!

Bean sprouts take 8-10 days to germinate, at an ideal temperature of 70-80 degrees fahrenheit

4

Once your bean has roots about 1 inch long, transplant your seed into a 2 inch deep hole - about 18 inches apart from surrounding plants

5

Watch as your beans sprout and grow!
